                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an antibody or antigen binding domain (or tragment, variant or derivative), which binds to an osteoprotegrin binding protein (OPGbp) and which is an antagonistic antibody. The antibody or antigen binding domain may be administered to inhibit spacedast formation or activation, inhibit bone recorption in a mammal, rewent or treat loss of bone mass in a mammal and to prevent or treat consourcell growth in bone. The loss of bone mass results from osteoporosis, metastasis of cancer to bone, rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                          Inti-OPGbp antibody heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                hypercalcaemia of malignancy and steroid-induced osteoporosis. The present sequence is an antibody heavy chain variable region complementarity determining region, CDR2, which can be incorporated an antibody/antigen binding domain of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antibodies that bind antagonistically to osteoprotegrin binding protein, useful for treating osteoporosis, metastasis of cancer bone, rheumatoid arthritis, hypercalcaemia of malignancy and steroid-induced osteoporosis -
                                                                                                                                                                                                                        Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

                                               The invention relates to an antibody or antigen binding domain (or fragment, variant or derivative), which binds to an osteoprotegrin binding protein (OPGbp) and which is an antagonistic antibody. The antibody or antigen binding domain may be administered to inhibit osteoclast formation or activation, inhibit bone resorption in a mammal prevent or treat loss of bone mass in a mammal and to prevent or treat loss of bone mass in a mammal and to prevent or treat tumour cell growth in bone. The loss of bone mass results from osteoporosis, metastasis of cancer to bone, rheumatoid arthritis, hypercalcaemia of malignancy and steroid-induced osteoporosis. The

                The present invention provides the protein and coding sequences for the variable regions of human monoclonal antibodies which are immunoreactive with human immunodeficiency virus-1 (HIV-1) envelope glycoprotein gp120. These can be used in diagnosis and therapy of HIV-1 infection.
                                                                                                                            Novel human monoclonal antibody immunoreactive with human immunodeficiency virus-1 glycoprotein gp120, useful for detecting HIV-1 in biological sample and providing passive immunotherapy to HIV-1
                                                                                                                                                                                            WPI; 2001-112438/12.

(I) has immunostimulant activity, and can be used as an immune system stimulant. (I) can be used in diagnostic and therapeutic medicine. The antibodies used in diagnostics that require human antibodies instead of animal antibodies, such as determine the Rh phenotype of human red blood cells. AAHG8615 to AAHG9726 represent the nucleotide sequence which encode AAG93558 to AAG93669. AAG93670 to AAG93697 represent anti-Rh(D) heavy than CDR3 amino acid sequences which are given in the exemplification

                                                                                                                                  Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli Xii Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAb regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The light chain VK region sequence AAR54307 is from a gp120-
                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                    New human monoclonal antibodies neutralising HIV - react with gp120 or gp41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human immunodeficiency virus; HIV1; glycoprotein gp120; epitope neutralisation; monoclonal antibody; kappa light chain; variable region; framework; complementarity determining region.

                      The sequences given in AAW01261-92 represent the light chain variable regions (VL) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein gp120 and are capable of neutralising HIV. This sequence represents the sequence of the JK1 gene clone, b24. A MAb containing this VL sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 mg of antibody(ml, and binds mature gp120 preferentially over the precursor gp160. The MAb may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection.
                                                                                                                                                                                                       Monoclonal antibody binding to V1/V2 loop of HIV gp120 -passive immuno:therapy and detection of HIV infection.

```
cc a human whole immunoglobulin (Ig) molecule which immunoreacts with HIV compatible immunoglobulin (Ig) molecule which immunoreacts with HIV cc gp160 and neutralises HIV and which reduces HIV infectivity titre in an cc in vitro virus infectivity assay by 50%, at a concentration of less than cc in vitro virus infectivity assay by 50%, at a concentration of less than cc in vitro virus infectivity assay by 50%, at a concentration of less than cc in vitro virus infectivity assay by 50%, at a concentration of less than cc in vitro virus infectivity assay by 50%, at a concentration of less than cc in vitro virus infectivity assay by 50%, at a concentration of less than cc in vitro virus infectivity as the diagnosts and cc infection in vitro virus infectivity and infectivity in the cc inmunocharal antibodies are useful information regarding the cc which can be used to screen human monoclonal antibodies to identify composition. The neutralising antibodies define new epitopes on the invention. The neutralising antibodies define new epitopes on the immunotherapeutic human monoclonal antibodies define new epitopes on the cc immunotherapeutic human monoclonal antibodies. A major advantages of the monoclonal antibodies for diagnosis and immunotherapy of HIV induced disease greatly composition and infective in vivo use of the monoclonal cc antibodies for diagnosis and immunotherapy of HIV induced disease greatly administered antibodies which is a problem commonly encountered when cc antibodies for diagnosis and immunotherapy of the monoclonal antibodies described derives from the fact that they inmunoreact with a unique determinant cc present on mature HIV glycoprotein gp120. This class of antibodies is a particularly effective at neutralising field isolates of HIV.

Human neutralizing monoclonal antibodies to human immunodeficiency virus (HIV) used for providing passive immunotherapy to HIV are specific for glycoprotein-120 -

Example 9; Figure 11; 374pp; English.

Immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease of and to patients who are already HIV-infected. The antibodies are used to neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting producing anti-idiotypic antibodies which can be used for active immunosation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 connoclonal antibodies are used to in the body or in body fluids by immunoassay. The anti-HIV gp-120 connoclonal antibodies are encoded by a human polynucleotide sequence and The invention relates to the production of an anti-HIV (human immunodefictency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 ng/ml. method for the production of the antibody comprises:

(a) providing a first polymucleotide encoding a heavy chain immunoglobulin amino acid sequence (which does not comprise the section temperated by AAY98206) and a second polymucleotide encoding a light immunoglobulin amino acid sequence (which does not comprise the section immunoglobulin amino acid sequence) sequences cell; and This sequence represents a fragment of the The invention relates to the production of (d) isolating (c) maintaining the host cell in conditions which allow the amino acid in immunoglobulin amino acid sequence, inserting the first and second polynu the antibody comprising the heavy and light chain and second polynucleotide sequences into a host antibodies of the invention sequence light The

-I FUNCTION: VISUAL PIGMENTS ARE THE LIGHT-ABSORBING MOLECULES THAT MEDIATR VISION. THEY CONSIST OF AN APOPROTEIN, OPSIN, COVALENTLY LINKED TO CIS-RETINAL.

-I SUBCELLULAR LOCATION: Integral membrane protein.
-I- TISSUB SPECIFICITY: RETINA. EXPRESSED IN THE DEPOLARIZING CELL LAYER OF THE PHOTORECPTOR CELLS DISTANT FROM THE LENS.
-I- PIM: SOME OR ALL OF THE CARBOXYL-TERMINAL SER OR THR RESIDUES MAY BE PHOSPHORYLATED (BY SIMILARITY).

-I- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.

A polyvalent or polyclonal antibody preparation comprising two antibodies of the invention are useful for suppressing a immune response in a patient. They are used for treating cancer, infectious diseases and promoting beneficial autoimmune reactions for the treatment of diseases with inflammatory or allergic components. The polyvalent or polyclonal preparations are useful for treating autoimmune diseases such as rheumatoid arthritis, myasthenia gravis and lupus erythematosus, multiple sclerosis, insulin-dependent diabetes mellitus, 'transplant rejection, and inflammation, graft versus hong disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       is present sequence represents the heavy chain variable region of sman antibody 1001. This antibody specifically binds to human crystotoxic T lymphocyte associated antigen-4 (CTLA-4). Such antibodies are used in methods for inducing, augmenting or prolonging an immune binding of human CTLA-4 to human B Tigands. The antibodies are also useful for treating autoimmune disease in a subject caused or exacerbated by increased activity of T cells and for treating prostate cancer, melanoma or epithelial cancer. A polyvalent or polyclonal

This polymer exhibits an amphiphillic structure and is used as a stabiliser for oil-in-water emulsions. The oil-in-water emulsion is used for producing foodstuffs, pharmaceutical products or cosmetic products by combining with nutritionally, pharmaceutically, and cosmetically suitable ingredients. It is also useful in photography.

밁 Ś

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived for the method involves contacting

ID NO 11580; 327pp + sequence listing; English

New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (CTLA) 4. Antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FR1-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune system to up-regulate immunodeficient disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Macches
     The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  4-FEB-2000; 2000US-0180312.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid byto of the invention.

                                                      hypertension, cardiac arrhythmias and congenital heart disease Note: The sequence data for this patent did not form part of the specification, but was obtained in electronic format directly the feature of the feature
                                                                                                                               By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of human heart and vascular system e.g. cardiovascular disease,
                                                                                                                                                                                                ABA21535-ABA41305). The present sequence is a protein encoded by one sucprobe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays
                                                                                                                                                                                                                                                                           The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart
                                                                                                                                                                                                                                                                                                                                                               Claim

GENERAL INFORMATION:

APPLICANT: XU, Y1

APPLICANT: HOOK, Magnus A.O.

TITLE OF INVENTION: SURFACE PROTEINS FROM GRAM-POSITIVE BACTERIA

FILE REFERENCE: P07196US01/BAS

CURRENT APPLICATION NUMBER: US/10/140,372

CURRENT FILING DATE: 2002-05-08

PRIOR APPLICATION NUMBER: US 60/289,132

PRIOR FILING DATE: 2001-05-08

Sequence 3, Application US/10140372 Publication No. US20030021789A1
